

The intent of this lab is:

- Push configurations to Source Code Management System (SCMS) to automatically provision storage with an application using a ScaleIO virtual environment.
 - Storage
 - Provision ScaleIO Block to be used by a container
 - Test storage provisioned to each of the environments

Note: Vipr Controller maybe be deployed on the ScaleIO nodes to reduce the number of VMs. Vipr requires 3 nodes min as does ScaleIO. This can be extended to VMAX, XIO and other arrays. These products were selected because they support running in a virtualized environment.
